

# Data Sheet

## 7-Segment-LED-Displays Codicount, Series 900

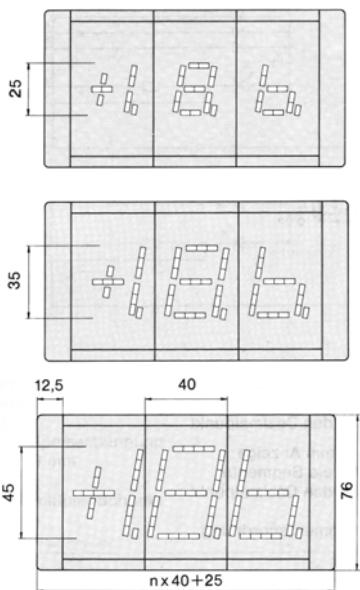

- Single digit red 7-segment LED display
- Character size 25, 35 and 45 mm, right hand decimal point
- Module width 40 mm
- Installation depth for all models 79 mm
- Housing black
- Operating voltages: 12, 15 and 24 V
- Combinable with Multiswitch G

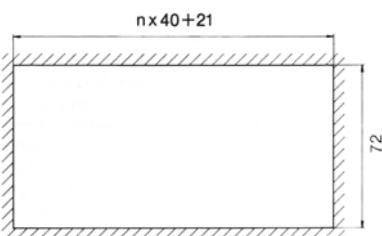

### Dimensions

## General data

Depending on the type and series involved, the modules are available with TTL or CMOS logic. The program also includes modules with matching elements for expanded supply voltage ranges.

The 7-Segment-LED-Displays with character heights of 9 mm, 16 mm, 25 mm, 35 mm and 45 mm feature parallax-free reading.

The individual modules are 8 mm, 10 mm, 20 mm and 40 mm wide. They can be assembled to form blocks of any size. They are particularly suitable for combination assemblies with the Multiswitches.

Low-power-Schottky logic (LS-TTL) is used in various TTL modules to reduce the supply current.

The inputs of the CMOS modules in series 800 are terminated with resistors. This puts non-used or non-connected inputs on a defined potential level.

The following logic condition definitions apply in the descriptions:

logic 0 = «0» = «L» = 0 V –  $U_{in}$  «0» max  
logic 1 = «1» = «H» =  $U_{in}$  «1» min –  $V_{CC}$

The following functions generally apply to decoders:

– LT (Lamp Test) When this input is set to «0», the character 8 will appear. This instruction is used to check the proper function of the segments.

– RBI (Ripple Blanking Input)  
This instruction is used to automatically blank zeros over an arbitrary number of digits. If this terminal is on «0» and if the BCD value is also «0000», the display will be blank.

– BI (Blanking Input) (for CMOS only)  
If this input is set to «0», the display will extinguish and overwrite all other available information with the exception of the «LT» instruction. Brightness control can be achieved by a clock with variable pulse width.

– RBO/BI (for TTL only)  
This terminal can be used either as an output or input.  
**RBO** (ripple blanking output)  
For zero blanking, this output is connected with the «RBI» terminal of the next lower decade.  
**BI** (blanking input)  
This input operates in a manner similar to the input for CMOS logic modules; it overwrites **all** other instructions. The basic distinction is in the control mode. Since this terminal can be an input or an output, access must be via integrated circuits with **open collectors**. Termination resistances should not be used, because they are already contained in the decoder. If this function is not needed, the terminal **must** remain open.

## General technical data

|   | TTL             | CMOS   |
|---|-----------------|--|
| Maximum permissible ambient temperature <sup>1)</sup> | 0 °C ... +50 °C | 0 °C ... +50 °C  |
| Supply voltage $V_{CC}$ *                             | +5 V ± 5 %      | + 5 V ± 5 %<br>+ 10 V ± 10 %<br>+ 12 V ± 10 %<br>+ 15 V ± 10 % |
| Count frequency                                       | ≤ 5 MHz         | ≤ 100 kHz  |

<sup>1)</sup> Separate or forced ventilation must be provided if the temperature increases beyond the specified limit.

|                              | TTL        | CMOS                 |
|------------------------------|------------|----------------------|
| Input voltage $U_{in}$       | max. 5.5 V | max. $V_{CC}$ +0.5 V |
| Rise and fall time on pulses | max. 40 ns | max. 15 µs           |
| Pulse width                  | min. 50 ns | min. 1 µs            |

\* Only the term  $V_{CC}$  is used for TTL and CMOS supply in all data and circuit diagrams.

All further deviating data are listed in the descriptions of the individual modules.

## IMPORTANT

### General handling directions

When using components in CMOS logic the strict observation of the following points are indispensable:

- Persons and equipment must be earthed.
- The relative humidity should be within the range between 40 and 50 %.
- Do not touch elements beyond the housing.
- The conductive rubber on the connector should not be removed but immediately before plug-in.
- Modules which are not incorporated in a circuitry have to be connected by conductive rubber with the connector.
- Modules in CMOS logic should be mounted in a circuit in the end.
- All inputs not used should be put to GND or  $V_{CC}$ .
- The maximum signal voltage should never be exceeded (see general technical data).
- Do never connect any outputs to  $V_{CC}$  or GND.
- Do not exceed the maximum values of the supply voltage (see general technical data).

## Accessories

Codicounts and/or Multiswitches can be assembled to blocks with the following accessories. Based on customer specification, Crameda provides block assembly of Codicount and Multiswitch to "ready to install" units. For details see section block assembly.

### Division Modules

If Codicounts and Multiswitches are joined to a block, division modules must be used.

| Order No.<br>1 piece | Colour of<br>housing | Assembly                     | Front frame<br>width | Module width |
|----------------------|----------------------|------------------------------|----------------------|--------------|
| 900-04-321           | black                | left side<br>of the display  | 20 mm                | 20 mm        |
| 900-04-322           |                      | right side<br>of the display |                      |              |

### End Brackets

The display assemblies are completed with end brackets on either side and held together with four threaded rods with slotted nuts. The display assemblies are secured in the front panel by retaining springs.

| Order No.<br>1 pair | Colour of<br>housing | Front panel<br>thickness | Front frame<br>width | Module width |
|---------------------|----------------------|--------------------------|----------------------|--------------|
| 900-03-302          | black                | 1.5 – 4 mm               | 12.5 mm              | 10 mm        |

### Threaded Rods

|                      |  |
|----------------------|--|
| Order No.<br>1 piece |  |
| G25x LLL mm          | LLL = 060 to 260 mm / 4 pieces are required per block. |

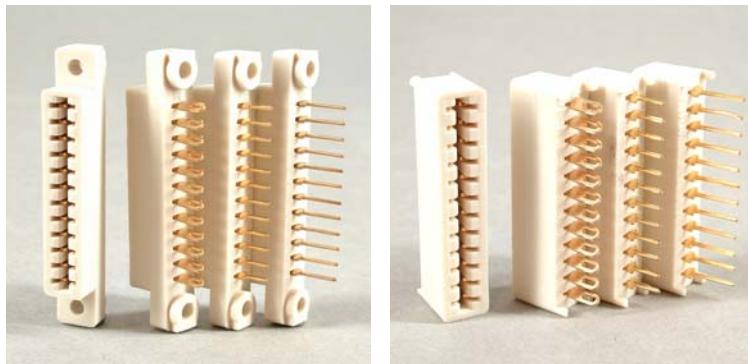

### Slotted Nuts

| Order No.<br>4 pieces | Order No.<br>20 pieces | Order No.<br>100 pieces |
|-----------------------|------------------------|-------------------------|
| M25A004               | M25A020                | M25A100                 |

### Plug in Connectors

Connectors are available with or without flange and different soldering pins.  
Details see Online Catalogue <Plug-in Connectors>.

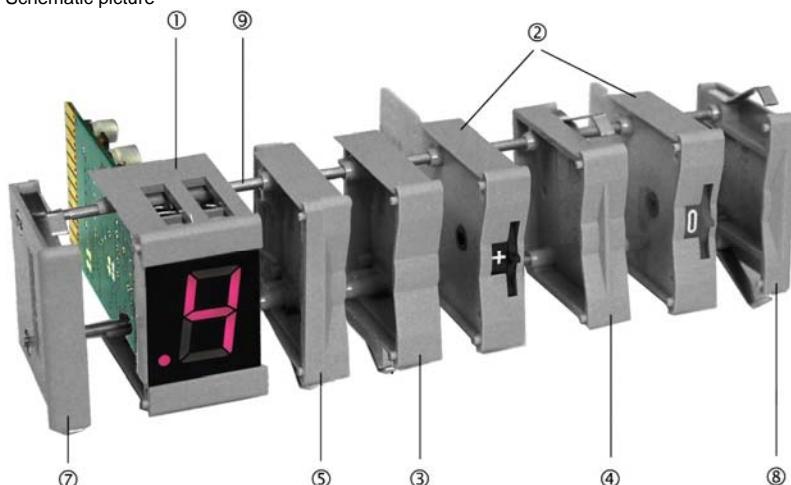

### Block Assembly: Mounting of Codicount and Multiswitch

#### Codicount Series 900 and Multiswitch Range G

Ready to install blocks are built-up by line up the individual modules (Codicount, Multiswitch, division module, left and right end brackets). The blocks are secured with threaded rods. The completed blocks are inserted into the cut-out of the front panel. Spring catches locate the block in the front panel.

Based on customer specification, Crameda provides block assembly of Codicount and Multiswitch to "ready to install" units.

Character height  
Depth behind panel

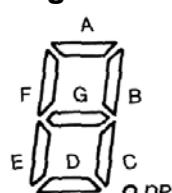

In these modules, all segments are wired directly to the terminations. They are operated with the 7-segment code.  
Two versions are available: with common anode (CA) or with common cathode (CC).

For a fixed decimal point, input DP is connected to 0 V or +V<sub>CC</sub> via the built-in\* current limiting resistor, depending on the model involved.

For the floating decimal point mode and particularly in multiplex operation, input DP' must be wired via an external driver.

\*The current limiting resistor value is adapted to 12 V DC.

This module is used to display sign and overflow ( $\pm 1$ ) and has been designed to match Type 01. All segments are wired directly to the terminations.

For a fixed decimal point, input DP is connected to 0 V or +V<sub>CC</sub>, depending on the model involved.

For the floating decimal point mode and particularly in multiplex operation, input DP' must be wired via an external driver.

DP current limiting resistor value is adapted to 12 V DC.

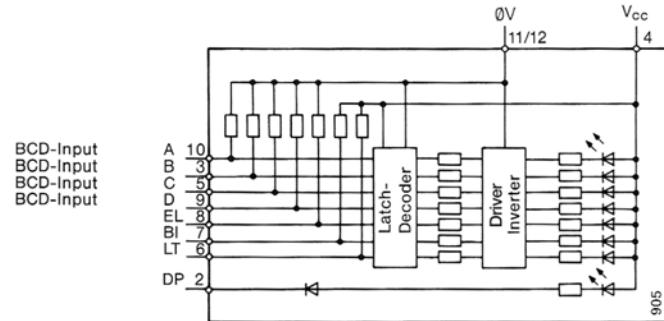

## Segment configuration

## Type 905

- ◆ 7-segment display
- ◆ BCD input
- ◆ Memory
- ◆ 12 or 15 V supply voltage

## Circuit Diagram

In this module, the display is operated by the BCD code in positive logic. A control signal (input EL) makes it possible to freeze the display without inhibiting the BCD input signals. The model features CMOS logic. All inputs are terminated with resistors.

**Caution:** The connections for TTL and CMOS logics are not identical.

Observe the General handling directions for CMOS logic elements (s. page Fehler! Textmarke nicht definiert.).

## Technical Data

Supply current  $I_{CC}$

$V_{CC} = 12 \text{ V} \pm 10 \%$

max. 126 mA

$V_{CC} = 15 \text{ V} \pm 10 \%$

max. 133 mA

Character height

79 mm

### Input data

Input voltage (all inputs)

Pull-up/Pull-down Resistors 100 k $\Omega$

U<sub>in</sub> «0» with V<sub>CC</sub> = 12 V max. 3.6 V  
V<sub>CC</sub> = 15 V max. 4.5 V

U<sub>in</sub> «1» with V<sub>CC</sub> = 12 V min. 8.4 V  
V<sub>CC</sub> = 15 V min. 10.5 V

Input currents

BCD inputs and EL

I<sub>in</sub> «0» with U<sub>in</sub> = 3.6 V max. 40  $\mu$ A  
U<sub>in</sub> = 4.5 V max. 46  $\mu$ A

I<sub>in</sub> «1» with U<sub>in</sub> = 8.4 V max. 86  $\mu$ A  
U<sub>in</sub> = 10.5 V max. 108  $\mu$ A

Inputs LT and BI

I<sub>in</sub> «0» with U<sub>in</sub> = 3.6 V max. 86  $\mu$ A  
U<sub>in</sub> = 4.5 V max. 108  $\mu$ A

I<sub>in</sub> «1» with U<sub>in</sub> = 8.4 V max. 40  $\mu$ A  
U<sub>in</sub> = 10.5 V max. 46  $\mu$ A

**DP (Decimal Point):** The decimal point must be controlled externally. The module features an integral current limiting resistor and a protective diode.

«DP» on «0» Decimal point on

«DP» on «1» Decimal point off

I<sub>in</sub> max. -23 mA

### Truth table

x = «0» or «1»

\* controlled by applied BCD code during the leading edge of the «EL» instruction signal.

## Type 915

- ◆ 7-segment display
- ◆ Memory
- ◆ BCD input
- ◆ Signal level adaptation
- ◆ 24 V supply voltage

### Circuit Diagram

In this module, the display is controlled with the BCD code in positive logic. The advantage of this module is that the signal and supply voltage can be anywhere between 12 and 30 V.

A control signal (input EL) makes it possible to freeze the display without inhibiting the incoming BCD signals.

### Technical Data

|                         |               |
|-------------------------|---------------|
| Supply voltage $V_{CC}$ | 12-30 V       |
| Supply current $I_{CC}$ | max. 95 mA    |
| Signal voltage          | 10-30 V       |
| Character height        | 25, 35, 45 mm |
| Depth behind panel      | 79 mm         |

#### Input data

Input voltage (all inputs)

|                    |                                      |
|--------------------|--------------------------------------|
| $U_{in} \ll 0 \gg$ | max. -3.5 V<br>max. 2.0 V<br>or open |
| $U_{in} \ll 1 \gg$ | min. 10 V<br>max. 30 V               |

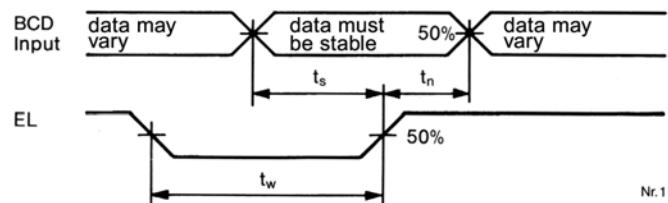

Input currents (all inputs)

|                         |                   |              |
|-------------------------|-------------------|--------------|
| $I_{in} \ll 0 \gg$ with | $U_{in} = -3.5 V$ | max. -0.4 mA |
|                         | $U_{in} = 2.0 V$  | max. 0.7 mA  |
| $I_{in} \ll 1 \gg$ with | $U_{in} = 10 V$   | max. 1.2 mA  |
|                         | $U_{in} = 30 V$   | max. 4.8 mA  |

Switching times

Input EL

|                              |       |             |
|------------------------------|-------|-------------|
| Length of memory instruction | $t_w$ | min. 160 ns |
| Length of setting time       | $t_s$ | min. 70 ns  |
| Length of holding time       | $t_h$ | min. 25 ns  |

DP (Decimal Point): The decimal point must be controlled externally. The module features an integral current limiting resistor and a protective diode.

«DP» on «0» Decimal point on

«DP» on «1» Decimal point off

$I_{in}$  max. -23 mA

#### Truth table

| Inputs |    |    |            |            |            |            | Outputs  |
|--------|----|----|------------|------------|------------|------------|----------|
